CMOS DUAL SyncFIFO ${ }^{\text {™ }}$

## FEATURES:

- The IDT72805LB is equivalent to two IDT72205LB 256 x 18 FIFOs
- The IDT72815LB is equivalent to two IDT72215LB $512 \times 18$ FIFOs
- The IDT72825LB is equivalent to two IDT72225LB $1,024 \times 18$ FIFOs
- The IDT72845LB is equivalent to two IDT72245LB $4,096 \times 18$ FIFOs
- Offers optimal combination of large capacity ( 8 K ), high speed, design flexibility, and small footprint
- Ideal for the following applications:
- Network switching
- Two level prioritization of parallel data
- Bidirectional data transfer
- Bus-matching between 18-bit and 36-bit data paths
- Width expansion to 36-bit per package
- Depth expansion to 8,192 words per package
- 10ns read/write cycle time, 6.5 ns access time
- IDT Standard or First Word Fall Through timing
- Single or double register-buffered Empty and Full Flags
- Easily expandable in depth and width
- Asynchronous or coincident Read and Write clocks
- Asynchronous or synchronous programmable Almost-Empty and Almost-Full flags with default settings
- Half-Full flag capability
- Output Enable puts output data bus in high-impedance state
- High-performance submicron CMOS technology
- Available in the 128-pin Thin Quad Flatpack (TQFP). Also available for the IDT72805LB/72815LB/72825LB, in the 121-lead, $16 \times 16 \mathrm{~mm}$ plastic Ball Grid Array (PBGA)
- Industrial temperature range $\left(-40^{\circ} \mathrm{C}\right.$ to $\left.+85^{\circ} \mathrm{C}\right)$ is available
- Green parts available, see ordering information

## DESCRIPTION:

The IDT72805LB/72815LB/72825LB/72845LB are dual 18-bit-wide synchronous (clocked) First-in, First-out (FIFO) memories. One dual IDT72805LB/

FUNCTIONAL BLOCK DIAGRAM

## DESCRIPTION (Continued)

72815LB/72825LB/72845LB device is functionally equivalent to two IDT72205LB/72215LB/72225LB/72245LB FIFOs in a single package with all associated control, data, and flag lines assigned to independent pins. These devices are very high-speed, low-power First-In,First-Out(FIFO) memories with clocked read and write controls. These FIFOs are applicable for a wide variety ofdatabufferingneeds,suchasopticaldiskcontrollers, Local AreaNetworks (LANs), and interprocessor communication.

Each of the two FIFOs contained in these devices has an 18-bit input and output port. Each input port is controlled by a free-running clock (WCLK), and an input enable pin ( $\overline{\mathrm{WEN}}$ ). Data is read into the synchronous FIFO on every clock when $\overline{W E N}$ is asserted. The output port of each FIFO bank is controlled by another clock pin (RCLK) and another enable pin ( $\overline{\operatorname{REN}})$. The Read Clock can be tied to the Write Clock for single clock operation or the two clocks can run asynchronous of one another for dual-clock operation. An Output Enable pin (OE) is provided on the read port of each FIFO for three-state control of the output.

The synchronous FIFOs have two fixed flags, Empty Flag/Output Ready

Almost-Empty $(\overline{\mathrm{PAE}})$ and Almost-Full $(\overline{\mathrm{PAF}})$. The offsetloading ofthe programmable flags is controlled by asimple state machine, and is initiated by asserting the Load pin ( $\overline{\mathrm{LD}}$ ). A Half-Full flag ( $\overline{\mathrm{HF}}$ ) is available for each FIFO that is implemented as a single device configuration.

There are two possible timing modes of operation with these devices: IDT Standard mode and First Word Fall Through (FWFT) mode.

In IDT Standard Mode, the first word written to an empty FIFO will not appear on the data output lines unless a specific read operation is performed. A read operation, which consists of activating REN and enabling a rising RCLK edge, will shift the word from internal memory to the data output lines.

In FWFT mode, the first word written to an empty FIFO is clocked directly to the data output lines after three transitions of the RCLK signal. A $\overline{R E N}$ does not have to be asserted for accessing the first word.

These devices are depth expandable using a daisy-chaintechnique or First Word Fall Through (FWFT) mode. The $\overline{\mathrm{XI}}$ and $\overline{\mathrm{XO}}$ pins are used to expand the FIFOs. Indepth expansion configuration, FLis grounded on the firstdevice and set to HIGH for all other devices in the Daisy Chain.

The IDT72805LB/72815LB/72825LB/72845LB are fabricated using highspeedsubmicronCMOStechnology.

## PIN CONFIGURATIONS

NOTE:

1. The PBGA is only available for the IDT72805LB/72815LB/72825LB in the 15 or 25 ns speed grade.

## PIN CONFIGURATIONS (Continued)

## PIN DESCRIPTION

| Symbol | Name | I/0 | Description |
| :---: | :---: | :---: | :---: |
| $\begin{aligned} & \text { DA0-DA17 } \\ & \text { DBo-DB17 } \end{aligned}$ | Datalnputs | 1 | Data inputs foran 18 -bitbus. |
| $\begin{aligned} & \overline{\mathrm{RSA}} \\ & \overline{\mathrm{RSB}} \end{aligned}$ | Reset | 1 | When $\overline{\mathrm{RS}}$ is set LOW, internal read and write pointers are set to the first location of the RAM array, $\overline{\mathrm{FF}}$ and $\overline{\mathrm{PAF}}$ go HIGH, and $\overline{\mathrm{PAE}}$ and $\overline{\mathrm{EF}}$ go LOW. A reset is required before an initial WRITE after power-up. |
| WCLKA WCLKB | Write Clock | I | When $\overline{\text { WEN }}$ is LOW, data is written into the FIFO on a LOW-to-HIGH transition of WCLK, if the FIFO is not full. |
| $\begin{aligned} & \overline{\mathrm{WENA}} \\ & \overline{\mathrm{WENB}} \end{aligned}$ | Write Enable | 1 | When $\overline{\text { WEN }}$ is LOW, data is written into the FIFO on every LOW-to-HIGH transition of WCLK. When $\overline{\text { WEN }}$ is HIGH, the FIFO holds the previous data. Data will not be written into the FIFO if the FF is LOW. |
| RCLKA RCLKB | Read Clock | 1 | When $\overline{\text { REN }}$ is LOW, data is read from the FIFO on a LOW-to-HIGH transition of RCLK, if the FIFO is not empty. |
| $\frac{\overline{\mathrm{RENA}}}{\overline{\mathrm{RENB}}}$ | Read Enable | 1 | When $\overline{R E N}$ is LOW, data is read from the FIFO on every LOW-to-HIGH transition of RCLK. When $\overline{R E N}$ is HIGH, the output register holds the previous data. Data will not be read from the FIFO if the EF is LOW. |
| $\begin{aligned} & \overline{\overline{O E A}} \\ & \overline{\mathrm{OEB}} \\ & \hline \end{aligned}$ | Output Enable | 1 | When $\overline{\mathrm{OE}}$ is LOW, the data output bus is active. If $\overline{\mathrm{OE}}$ is HIGH, the output data bus will be in a high-impedance state. |
| $\overline{\overline{\mathrm{LDA}}}$ | Load | 1 | When $\overline{\mathrm{LD}}$ is LOW, data on the inputs D0-D11 is written to the offset and depth registers on the LOW-to-HIGH transition of the WCLK, when $\overline{W E N}$ is LOW. When $\overline{\mathrm{LD}}$ is LOW, data on the outputs Q0-Q11 is read from the offset and depth registers on the LOW-to-HIGH transition of the RCLK, when $\overline{\text { REN }}$ is LOW. |
| $\begin{aligned} & \overline{\mathrm{FLA}} \\ & \overline{\mathrm{FLB}} \end{aligned}$ | First Load | 1 | In the single device or width expansion configuration, $\overline{\mathrm{FL}}$ together with $\overline{\mathrm{WXI}}$ and $\overline{\mathrm{RXI}}$ determine if the mode is IDT Standard mode or First Word Fall Through (FWFT) mode, as well as whether the $\overline{\text { PAE }} / \overline{\mathrm{PAF}}$ flags are synchronous or asynchronous. (See Table I.) In the Daisy Chain Depth Expansion configuration, $\overline{F L}$ is grounded on the first device (first load device) and set to HIGH for all other devices in the Daisy Chain. |
| $\overline{\overline{W X I A}} \overline{\overline{W X I B}}$ | Write Expansion Input | 1 | In the single device or width expansion configuration, $\overline{\mathrm{WXI}}$ together with $\overline{\mathrm{FL}}$ and $\overline{\mathrm{RXI}}$ determine if the mode is IDT Standard mode or FWFT mode, as well as whether the $\overline{\text { PAE }} / \overline{\text { PAF }}$ flags are synchronous or asynchronous. (See Table 1.) In the Daisy Chain Depth Expansion configuration, $\overline{\mathrm{WXI}}$ is connected to $\overline{\mathrm{WXO}}$ (Write Expansion Out) of the previous device. |
| $\begin{aligned} & \overline{\overline{R X I A}} \\ & \overline{R X I B} \end{aligned}$ | Read Expansion Input | 1 | In the single device or width expansion configuration, $\overline{\mathrm{RXI}}$ together with $\overline{\mathrm{FL}}$ and $\overline{\mathrm{WXI}}$, determine if the mode is IDT Standard mode or FWFT mode, as well as whether the $\overline{\text { PAE }} \overline{\text { PAF }}$ flags are synchronous or asynchronous. (See Table 1.) In the Daisy Chain Depth Expansion configuration, $\overline{\mathrm{RXI}}$ is connected to $\overline{\mathrm{RXO}}$ (Read Expansion Out) of the previous device. |
| $\begin{aligned} & \overline{\mathrm{FFA}} / \overline{\mathrm{RA}} \\ & \overline{\mathrm{FFB}} / \overline{\mathrm{RB}} \end{aligned}$ | Full Flag/ Input Ready | 0 | In the IDT Standard mode, the $\overline{F F}$ function is selected $\overline{\mathrm{FF}}$ indicates whether or not the FIFO memory is full. In the FWFT mode, the $\overline{\mathrm{R}}$ function is selected. $\overline{\mathrm{R}}$ indicates whether or not there is space available for writing to the FIFO memory. |
| $\begin{aligned} & \overline{\mathrm{EFA}} / \overline{\mathrm{ORA}} \\ & \overline{\mathrm{EFB}} / \overline{\mathrm{ORB}} \end{aligned}$ | Empty Flag/ Output Ready | 0 | In the IDT Standard mode, the $\overline{\mathrm{EF}}$ function is selected. $\overline{\mathrm{EF}}$ indicates whether or not the FIFO memory is empty. In FWFT mode, the $\overline{\mathrm{OR}}$ function is selected. $\overline{\mathrm{OR}}$ indicates whether or not there is valid data available at the outputs. |
| $\overline{\overline{\mathrm{PAEA}}}$ | Programmable Almost-Empty flag | 0 | When $\overline{\text { PAE }}$ is LOW, the FIFO is almost-empty based on the offset programmed into the FIFO. The default offset at reset is 31 from empty for IDT72805LB, 63 from empty for IDT72815LB, and 127 from empty for IDT72825LB/72845LB. |
| $\begin{aligned} & \overline{\mathrm{P} \bar{A} \bar{F} \bar{A}} \\ & \overline{\mathrm{P}} \overline{\mathrm{~F}} \overline{\mathrm{~B}} \end{aligned}$ | Programmable Almost-Full flag | 0 | When $\overline{\text { PAF }}$ is LOW, the FIFO is almost-full based on the offset programmed into the FIFO. The default offset at reset is 31 from full for IDT72805LB, 63 from full for IDT72815LB, and 127 from full for IDT72825LB/72845LB. |
| $\begin{aligned} & \overline{\overline{W X O A}} / \overline{\mathrm{HF} \bar{A}} \\ & \overline{\mathrm{WXOB}} / \overline{\mathrm{HF}} \end{aligned}$ | Write Expansion Out/Half-Full Flag | 0 | In the single device or width expansion configuration, the device is more than half full when $\overline{\mathrm{HF}}$ is LOW. In the depth expansion configuration, a pulse is sent from $\overline{\mathrm{WXO}}$ to $\overline{\mathrm{WXI}}$ of the next device when the last location in the FIFO is written. |
| $\overline{\overline{R X O A}} \overline{\mathrm{RXOB}}$ | Read Expansion Out | 0 | In the depth expansion configuration, a pulse is sent from $\overline{\mathrm{RXO}}$ to $\overline{\mathrm{RXI}}$ of the next device when the last location in the FIFO is read. |
| $\begin{aligned} & \text { QA0-QA17 } \\ & \text { QB0-QB17 } \end{aligned}$ | Data Outputs | 0 | Data outputs for an 18-bit bus. |
| Vcc | Power |  | +5V power supply pins. |
| GND | Ground |  | Ground pins. |

## ABSOLUTE MAXIMUM RATINGS

| Symbol | Rating | Commercial | Unit |
| :--- | :--- | :---: | :---: |
| VTERM | Terminal Voltage <br> with respect to GND | -0.5 to +7.0 | V |
| TSTG | Storage <br> Temperature | -55 to +125 | ${ }^{\circ} \mathrm{C}$ |
| IOUT | DC Output Current | -50 to +50 | mA |

NOTE:

1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

## RECOMMENDED DC OPERATING CONDITIONS

| Symbol | Parameter | Min. | Typ. | Max. | Unit |
| :---: | :--- | :---: | :---: | :---: | :---: |
| Vcc | Supply Voltage (Com'//Ind'I) | 4.5 | 5.0 | 5.5 | V |
| GND | Supply Voltage (Com'//Ind'I) | 0 | 0 | 0 | V |
| $\mathrm{VIH}^{\prime}$ | Input High Voltage (Com'///Ind'I) | 2.0 | - | - | V |
| $\mathrm{VIL}^{(1)}$ | Input Low Voltage (Com'//Ind'I) | - | - | 0.8 | V |
| $\mathrm{TA}_{\mathrm{A}}$ | Operating Temperature <br> Commercial | 0 | - | 70 | ${ }^{\circ} \mathrm{C}$ |
| TA | Operating Temperature <br> Industrial | -40 | - | 85 | ${ }^{\circ} \mathrm{C}$ |

NOTE:

1. 1.5 V undershoots are allowed for 10 ns once per cycle.

## DC ELECTRICAL CHARACTERISTICS

(Commercial: $\mathrm{VCC}=5 \mathrm{~V} \pm 10 \%, \mathrm{TA}=0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$; Industrial: $\mathrm{VCC}=5 \mathrm{~V} \pm 10 \%, \mathrm{TA}=-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ )

| Symbol | Parameter | IDT72805LB <br> IDT72815LB <br> IDT72825LB <br> IDT72845LB <br> Com'I \& Ind' ${ }^{(1)}$ $\text { tcLK }=10,15,25 \mathrm{~ns}$ |  |  | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min. | Typ. | Max. |  |

| Icc2 ${ }^{(4,7)}$ | Standby Current | - | - | 10 | mA |

NOTES:

1. Industrial Temperature Range Product for the 15 ns speed grade is available as a standard device.
2. Measurements with $0.4 \leq \mathrm{V} \mathrm{IN} \leq \mathrm{Vcc}$.
3. $\overline{\mathrm{OE}} \geq \mathrm{V}$ IH, $0.4 \leq$ Vout $\leq \mathrm{VCC}$.
4. Tested with outputs open (lout $=0$ ).
5. RCLK and WCLK toggle at 20 MHZ and data inputs switch at 10 MHz .
6. For the IDT72805LB/72815LB/72825LB the typical IcC1 $=2\left[1.81+1.12^{*} f s+0.02^{*} \mathrm{CL} \mathrm{Lfs}^{2}\right]$ (in mA );
for the IDT72845LB the typical Icc1 $=2[2.85+1.30 * f s+0.02 * C L * * s]$ (in mA).
These equations are valid under the following conditions:
$\mathrm{Vcc}=5 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$, fs = WCLK frequency = RCLK frequency (in MHz, using TTL levels), data switching at fs/2, CL= capacitive load (in pF).
7. All Inputs $=\mathrm{Vcc}-0.2 \mathrm{~V}$ or GND +0.2 V , except RCLK and WCLK, which toggle at 20 MHz .

CAPACITANCE $\left(\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}, \mathrm{f}=1.0 \mathrm{MHz}\right)$

| Symbol | Parameter ${ }^{(1)}$ | Conditions | Max. | Unit |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{CIN}^{(2)}$ | Input <br> Capacitance | $\mathrm{VIN}=0 \mathrm{~V}$ | 10 | pF |
| CouT $^{(1,2)}$ | Output <br> Capacitance | Vout $=0 \mathrm{~V}$ | 10 | pF |

## NOTES:

1. With output deselected, $(\overline{\mathrm{OE}} \geq \mathrm{VIH})$.
2. Characterized values, not currently tested.

## ACELECTRICAL CHARACTERISTICS

(Commercial: $\mathrm{Vcc}=5 \mathrm{~V} \pm 10 \%, \mathrm{TA}=0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$; Industrial: $\mathrm{Vcc}=5 \mathrm{~V} \pm 10 \%, \mathrm{TA}=-40^{\circ} \mathrm{C}+85^{\circ} \mathrm{C}$ )

| Input Rise/Fall Times | 3 ns |
| Input Timing Reference Levels | 1.5 V |
| Output Reference Levels | 1.5 V |
| Output Load | See Figure 1 |

Figure 1. Output Load

* Includes jig and scope capacitances.

## FUNCTIONAL DESCRIPTION

## TIMING MODES: IDT STANDARD vs FIRST WORD FALL THROUGH (FWFT) MODE

TheIDT72805LB/72815LB/72825LB/72845LBsupporttwo differenttiming modes of operation. The selection of which mode will operate is determined during configuration at Reset $(\overline{\mathrm{RS}})$. During a $\overline{\mathrm{RS}}$ operation, the FirstLoad $(\overline{\mathrm{FL}})$, Read Expansion Input ( $\overline{\mathrm{RXI})}$ ) and Write Expansion Input $(\overline{\mathrm{WXI}})$ pins are used to select the timing mode per the truth table shown in Table 3. In IDT Standard Mode, the firstword writtento an empty FIFO will not appear onthe data output lines unless a specific read operation is performed. A read operation, which consists of activating Read Enable ( $\overline{\operatorname{REN}}$ ) and enabling a rising Read Clock (RCLK) edge, will shift the word from internal memory to the data outputlines. InFWFT mode, the firstword written to an empty FIFO is clocked directly to the dataoutputlines afterthreetransitions of the RCLK signal. A $\overline{R E N}$ does nothave to be asserted for accessing the firstword.

Varioussignals, bothinputand outputsignals operatedifferently depending on whichtiming mode is in effect.

## IDT STANDARD MODE

In this mode, the status flags, $\overline{F F}, \overline{P A F}, \overline{H F}, \overline{\text { PAE }}$ and $\overline{\mathrm{EF}}$ operate in the manner outlined in Table 1. To write data into to the FIFO, Write Enable ( $\overline{\mathrm{WEN}}$ ) must be LOW. Data presented to the DATA IN lines will be clocked into the FIFO on subsequent transitions of the Write Clock (WCLK). After the first write is performed, the Empty Flag ( $\overline{\mathrm{EF}}$ ) will go HIGH. Subsequent writes will continue to fill up the FIFO. The Programmable Almost-Empty flag ( $\overline{\mathrm{PAE}})$ will go HIGH after $\mathrm{n}+1$ words have been loaded into the FIFO, where $n$ is the Empty offset value. The default setting for this value is stated in the footnote of Table 1. This parameter is also user programmable. See section on Programmable Flag Offset Loading.

If one continued to write data into the FIFO, and we assumed no read operations were taking place, the Half-Full flag ( $\overline{\mathrm{HF}}$ ) would toggle to LOW once the 129th (IDT72805LB), 257th (IDT72815LB), 513th (IDT72825LB), and 2,049th (IDT72845LB) word respectively was written into the FIFO. Continuing to write datainto the FIFO will cause the Programmable Almost-Full flag ( $\overline{\mathrm{PAF}}$ ) to go LOW. Again, if no reads are performed, the $\overline{\mathrm{PAF}}$ will go LOW after (256-m) writes for the IDT72805LB, (512-m) writes for the IDT72815LB, (1,024-m) writesforthe IDT72825LB, and (4,096-m) writes for the IDT72845LB. Theoffset " $m$ " is the Full offsetvalue. This parameter is alsouser programmable. See section on Programmable Flag Offset Loading. If there is no Full offset specified, the $\overline{\mathrm{PAF}}$ will be LOW whenthe device is 31 away from completely full for IDT72805LB, 63 away from completely full for IDT72815LB, and 127 away from completely full for the IDT72825LB/72845LB.

Whenthe FIFO is full, the Full Flag ( $\overline{\mathrm{FF}})$ will go LOW, inhibiting further write operations. Ifno reads are performed afterareset, $\overline{\mathrm{FF}}$ will goLOW after D writes to theFIFO. D=256 writes for the IDT72805LB,512 fortheIDT72815LB, 1,024 for the IDT72825LB, and 4,096 for the IDT72845LB, respectively.

If the FIFO is full, the first read operation will cause $\overline{\mathrm{FF}}$ to go HIGH. Subsequent read operations will cause $\overline{\mathrm{PAF}}$ and the Half-Full flag $(\overline{\mathrm{HF}})$ to go HIGH at the conditions described in Table 1. If further read operations occur, without write operations, the Programmable Almost-Empty flag ( $\overline{\mathrm{PAE}}$ ) will go LOW when there are $n$ words in the FIFO, where $n$ is the Empty offset value. If there is no Empty offset specified, the $\overline{\mathrm{PAE}}$ will be LOW when the device is 31 away from completely empty for IDT72805LB, 63 away from completely empty for IDT72815LB, and 127 away from completely empty for IDT72825LB/72845LB. Continuing read operations will cause the FIFO to be
empty. When the last word has been read from the FIFO, the $\overline{\mathrm{EF}}$ will go LOW inhibiting further read operations. $\overline{R E N}$ is ignored when the FIFO is empty.

## FIRST WORD FALL THROUGH MODE (FWFT)

In this mode, the status flags, $\overline{\mathrm{IR}}, \overline{\mathrm{PAF}}, \overline{\mathrm{HF}}, \mathrm{PAE}$ and $\overline{\mathrm{OR}}$ operate in the manner outlined in Table 2. To write data into to the FIFO, $\overline{\text { WEN }}$ must be LOW. Data presented to the DATA IN lines will be clocked into the FIFO on subsequent transitions of WCLK. After the first write is performed, the Output Ready $(\overline{\mathrm{OR}})$ flag will go LOW. Subsequent writes will continue to fill up the FIFO. $\overline{\text { PAE }}$ will go HIGH after $n+2$ words have been loaded into the FIFO, where $n$ is the Empty offset value. The default setting for this value is stated in the footnote of Table 2. This parameter is also user programmable. See section on Programmable Flag Offset Loading.

If one continued to write data into the FIFO, and we assumed no read operations were taking place, the $\overline{\mathrm{HF}}$ would toggle to LOW once the 130th (72805LB), 258th (72815LB), 514th (72825LB), and 2,050th (72845LB) word respectively was written into the FIFO. Continuing to write data into the FIFO will cause the $\overline{\mathrm{PAF}}$ to go LOW. Again, if no reads are performed, the $\overline{\mathrm{PAF}}$ will go LOW after ( $257-\mathrm{m}$ ) writes for the IDT72805LB, (513-m) writes for the IDT72815LB, (1,025-m) writes for the IDT72825LB, and (4,097-m) writes for the IDT72845LB, wheremistheFull offsetvalue. Thedefaultsetting forthisvalue is stated in the footnote of Table 2.

When the FIFO is full, the Input Ready ( $\overline{\mathrm{R}})$ flag will go HIGH, inhibiting further write operations. If no reads are performed after a reset, $\overline{\mathrm{I}}$ will go HIGH after D writes to the FIFO. $D=257$ writes for the IDT72805LB, 513 for the IDT72815LB, 1,025 for the IDT72825LB, and 4,097 for the IDT72845LB. Note thatthe additional word inFWFT mode is due tothe capacity of the memory plus output register.

If the FIFO is full, the first read operation will cause the $\overline{\mathrm{R}}$ flag to go LOW. Subsequent read operations will cause the $\overline{\mathrm{PAF}}$ and $\overline{\mathrm{HF}}$ to go HIGH at the conditions described in Table 2. If further read operations occur, without write operations, the $\overline{\text { PAE }}$ will go LOW when there are $n+1$ words in the FIFO, where n is the Empty offset value. If there is no Empty offset specified, the $\overline{\mathrm{PAE}}$ will be LOW when the device is 32 away from completely empty for IDT72805LB, 64 away from completely empty for IDT72815LB, and 128 away from completely empty for IDT72825LB/72845LB. Continuing read operations will cause the FIFO to beempty. Whenthe lastword has been read from the FIFO, $\overline{\text { OR }}$ will go HIGH inhibiting further read operations. $\overline{R E N}$ is ignored when the FIFO is empty.

## PROGRAMMABLE FLAG LOADING

Full and Empty flag Offset values can be user programmable. The IDT72805LB/72815LB/72825LB/72845LB has internal registers for these offsets. Defaultsettings are stated inthe footnotes of Table 1 and Table 2. Offset values are loaded into the FIFO using the data input lines Do-D11. To load the offsetregisters, the Load ( $\overline{\mathrm{LD}})$ pinand $\overline{W E N}$ pin mustbeheld LOW. Datapresent on Do-D11 will be transferred in to the Empty Offset register on the first LOW-to-HIGHtransition ofWCLK. By continuing to hold the $\overline{L D}$ and $\overline{W E N}$ pinlow, data present on Do-D11 will be transferred into the Full Offset register on the next transition of the WCLK. The third transition again writes to the Empty Offset register. Writing all offset registers does not have to occur at one time. One or two offset registers can be written and then by bringing the $\overline{L D}$ pin HIGH , the FIFO is returned to normal read/write operation. When the $\overline{\mathrm{LD}}$ pin and $\overline{\mathrm{WEN}}$ are again setLOW, the next offset register in sequence is written.

The contents of the offset registers can be read on the data output lines Q0Q11 when the $\overline{L D}$ pin is set LOW and $\overline{R E N}$ is set LOW. Data can then be read
on the nextLOW-to-HIGH transition of RCLK. The first transition of RCLK will present the Empty Offset value to the data output lines. The next transition of RCLK will present the Full offset value. Offset register content can be read out in the IDT Standard mode only. It cannot be read in the FWFT mode.

## SYNCHRONOUS vs ASYNCHRONOUS PROGRAMMABLE FLAG TIMING SELECTION

The IDT72805LB/72815LB/72825LB/72845LB can be configured during the "ConfigurationatReset"cycledescribedinTable3witheitherasynchronous or synchronous timing for $\overline{\mathrm{PAE}}$ and $\overline{\mathrm{PAF}}$ flags.

If asynchronous $\overline{\mathrm{PAE}} / \overline{\mathrm{PAF}}$ configuration is selected (as per Table 3), the $\overline{\text { PAE }}$ is asserted LOW on the LOW-to-HIGH transition of RCLK. $\overline{\text { PAE }}$ is reset to HIGH on the LOW-to-HIGH transition of WCLK. Similarly, the $\overline{\text { PAF }}$ is asserted LOW on the LOW-to-HIGH transition of WCLK and $\overline{\text { PAF }}$ is reset to HIGH on the LOW-to-HIGH transition of RCLK. For detail timing diagrams, see Figure 13 for asynchronous $\overline{\text { PAE }}$ timing and Figure 14 for asynchronous $\overline{\mathrm{PAF}}$ timing.

Ifsynchronous $\overline{\mathrm{PAE}} / \overline{\mathrm{PAF}}$ configuration is selected, the $\overline{\mathrm{PAE}}$ is asserted and updated on the rising edge of RCLK only and not WCLK. Similarly, $\overline{\text { PAF }}$ is asserted and updated onthe rising edge ofWCLK only and notRCLK. For detail timing diagrams, see Figure 22 for synchronous $\overline{\text { PAE }}$ timing and Figure 23 for synchronous $\overline{\mathrm{PAF}}$ timing.

## REGISTER-BUFFERED FLAG OUTPUT SELECTION

The IDT72805LB/72815LB/72825LB/72845LB can be configured during the "Configuration at Reset" cycle described in Table 4 with single, double or triple register-buffered flag outputsignals. The various combinations available are described in Table 4 and Table 5. In general, going from single to double ortriplebufferedflag outputsremovesthepossibility ofmetastableflagindications on boundary states(i.e, empty or full conditions). The trade-off is the addition of clock cycle delays for the respective flag to be asserted. Notall combinations of register-buffered flag outputs are supported. Register-buffered outputs apply to the Empty Flag and Full Flag only. Partial flags are noteffected. Table 4 and Table 5summarize the options available.

TABLE 1 - STATUS FLAGS FOR IDT STANDARD MODE

| Number of Words in FIFO |  |  |  | $\overline{\text { FF }}$ | $\overline{\text { PAF }}$ | $\overline{\mathrm{HF}}$ | $\overline{\text { P }} \overline{\mathrm{E}}$ | $\overline{E F}$ |

| $1^{(2)}$ | 1 | 1 | Single register-buffered <br> Empty Flag | Single register-buffered <br> Full Flag | Asynchronous | Standard |

NOTES:

1. In a daisy-chain depth expansion, $\overline{\mathrm{FL}}$ is held LOW for the "first load device". The $\overline{\mathrm{RXI}}$ and $\overline{\mathrm{WXI}}$ inputs are driven by the corresponding $\overline{\mathrm{RXO}}$ and $\overline{\mathrm{WXO}}$ outputs of the preceding device.
2. In a daisy-chain depth expansion, $\overline{\mathrm{FL}}$ is held HIGH for members of the expansion other than the "first load device". The RXI and WXI inputs are driven by the corresponding RXO and $\overline{\text { WXO }}$ outputs of the preceding device.

## SIGNAL DESCRIPTIONS:

## INPUTS:

DATA IN (D0 - D17)

Datainputs for 18-bitwide data.

## CONTROLS:

## RESET (RSA/RSB)

Reset is accomplished whenever the Reset $(\overline{\operatorname{RSA}} / \overline{\operatorname{RSB}})$ input is taken to a LOW state. During reset, both internal read and write pointers are set to the first location. A reset is required after power-up before a write operation can take place. The Half-Full flag ( $\overline{\mathrm{HFA}} / \overline{\mathrm{HFB}}$ ) and Programmable AlmostFull flag (PAFA/PAFB) will be reset to HIGH after trsf. The Programmable Almost-Empty flag (PAEA/PAEB) will be reset to LOW after trsF. The Full Flag ( $\overline{\mathrm{FFA}} / \overline{\mathrm{FFB}}$ ) will reset to HIGH . The Empty Flag ( $\overline{\mathrm{EFA}} / \overline{\mathrm{EFB}}$ ) will reset to LOW in IDT Standard mode but will reset to HIGH in FWFT mode. During reset, the output register is initialized to all zeros and the offset registers are initialized to their default values.

## WRITE CLOCK (WCLKA/WCLKB)

A write cycle is initiated on the LOW-to-HIGH transition of the Write Clock (WCLKA/WCLKB). Data setup and hold times must be met with respect to the LOW-to-HIGH transition of WCLK.

The Write and Read Clocks can be asynchronous or coincident.

## WRITE ENABLE ( $\overline{\text { WENA/ }}$ /WENB $)$

When the $\overline{W E N A} / \overline{W E N B}$ input is LOW, data may be loaded into the FIFO RAM array on the rising edge of every WCLK cycle if the device is not full. Data is stored in the RAM array sequentially and independently of any ongoing read operation.

When WEN is HIGH, no new data is written in the RAM array on each WCLK cycle.

To prevent data overflow in the IDT Standard Mode, $\overline{F F}$ will go LOW, inhibiting further write operations. Upon the completion of a valid read cycle, $\overline{\mathrm{FF}}$ will go HIGH allowing a write to occur. The $\overline{\mathrm{FF}}$ flag is updated on the rising edge of WCLK.

To prevent data overflow in the FWFT mode, Input Ready ( $\overline{\mathrm{RA}}, \overline{\mathrm{RB}})$ will go HIGH, inhibiting further write operations. Upon the completion of a valid read cycle, $\overline{\mathbb{R}}$ will go LOW allowing a write to occur. The $\overline{\mathbb{R}}$ flag is updated on the rising edge of WCLK.

WENis ignoredwhenthe FIFO isfull ineitherFWFT or IDTStandard mode.

## READ CLOCK (RCLKA/RCLKB)

Data can be read on the outputs on the LOW-to-HIGH transition of the Read clock (RCLKA/RCLKB), when OutputEnable ( $\overline{\mathrm{OEA}} / \overline{\mathrm{OEB}}$ ) is set LOW.

The Write and Read Clocks can be asynchronous or coincident.

## READ ENABLE $(\overline{\operatorname{RENA}} / \overline{\operatorname{RENB}})$

When Read Enable ( $\overline{\operatorname{RENA}} / \overline{\operatorname{RENB}})$ is LOW, data is loaded from the RAM array into the output register on the rising edge of every RCLK cycle if the device is not empty.

When the REN input is HIGH, the output register holds the previous data and no new data is loaded into the output register. The data outputs Qo-Qn maintain the previous data value.

In the IDT Standard mode, every word accessed at Qn, including the first word written to an empty FIFO, must be requested using REN. When the last word has been read from the FIFO, the Empty Flag (EFA/EFB) will go LOW, inhibiting further read operations. $\overline{\text { REN }}$ is ignored when the FIFO is

| $\overline{\mathrm{LD}}$ | $\overline{\mathrm{WEN}}$ | WCLK | Selection |
| :--- | :---: | :---: | :--- |
| 0 | 0 | $\boxed{ }$ | Writing to offset registers: <br> Empty Offset <br> Full Offset |
| 0 | 1 | No Operation |  |
| 1 | 0 | $\boxed{ }$ | Write Into FIFO |
| 1 | 1 | $\boxed{ }$ | No Operation |

## NOTE:

1. The same selection sequence applies to reading from the registers. $\overline{\mathrm{REN}}$ is enabled and read is performed on the LOW-to-HIGH transition of RCLK.

Figure 2. Writing to Offset Registers

| 11 |
| :---: |

NOTE:

1. Any bits of the offset register not being programmed should be set to zero.

Figure 3. Offset Register Location and Default Values
empty. Once a write is performed, $\overline{\mathrm{EF}}$ will go HIGH allowing a read to occur. The EF flag is updated on the rising edge of RCLK.

In the FWFT mode, the first word written to an empty FIFO automatically goes to the outputs Qn , on the third valid LOW to HIGH transition of RCLK +tskEw after the firstwrite. $\overline{\text { REN }}$ does notneed to be asserted LOW. In order to access all other words, a read must be executed using REN. The RCLK LOW to HIGH transition after the last word has been read from the FIFO, Output Ready ( $\overline{\mathrm{ORA}} / \overline{\mathrm{ORB}}$ ) will go HIGH with a true read (RCLK with $\overline{\mathrm{REN}}$ $=$ LOW), inhibiting further read operations. REN is ignored when the FIFO is empty.

## OUTPUT ENABLE ( $\overline{\mathrm{OEA}} / \overline{\mathrm{OEB}})$

When Output Enable ( $\overline{(\mathrm{EA}} / \overline{\mathrm{OEB}}$ ) is enabled (LOW), the parallel output buffers receive data from the output register. When $\overline{\text { OE }}$ is disabled (HIGH), the Q output data bus is in a high-impedance state.

## LOAD ( $\overline{\mathrm{LDA}} / \overline{\mathrm{LDB}})$

The IDT72805LB/72815LB/72825LB/72845LBdevices containtwo 12-bit offsetregisters with data on the inputs, or read on the outputs. When the Load (LDA/LDB) pinis setLOW and WEN is setLOW, data on the inputs D0-D11 is writtenintothe Empty Offsetregister onthe firstLOW-to-HIGH transition ofthe Writeclock(WCLK).Whenthe $\overline{L D}$ pinand WENareheld LOWthendataiswriten intotheFull Offsetregister onthe second LOW-to-HIGHtransition ofWCLK. The third transition of WCLK again writes to the Empty Offsetregister.

However, writing all offsetregisters does nothave to occur atone time. One or two offsetregisters can be written and then by bringing the $\overline{L D}$ pinHIGH, the FIFO is returned to normal read/write operation. When the $\overline{\mathrm{D}}$ pin is setLOW, and $\overline{W E N}$ is LOW, the next offset register in sequence is written.

Whenthe $\overline{L D}$ pinisLOW and $\overline{W E N}$ is HIGH, theWCLKinputisdisabled; then a signal atthis input can neither increment the write offset register pointer, nor execute a write.

The contents of the offset registers can be read on the output lines when the $\overline{\mathrm{LD}}$ pin is set LOW and $\overline{\mathrm{REN}}$ is set LOW; then, data can be read on the LOW-to-HIGH transition of the Read clock (RCLK). The act of reading the control registers employs a dedicated read offset register pointer. (The read and write pointers operate independently). Offset register content can be read out in the IDT Standard mode only. It is inhibited in the FWFT mode.

A read and a write should not be performed simultaneously to the offset registers.

## FIRST LOAD ( $\overline{\text { FLA/ } / \overline{F L B}}$ )

For the single device mode, see Table I for additional information. In the Daisy Chain Depth Expansion configuration, $\overline{\mathrm{FLA}} / \overline{\mathrm{FLB}}$ is grounded to indicate it is the first device loaded and is set to HIGH for all other devices in the Daisy Chain. (See Operating Configurations for further details.)

## WRITE EXPANSION INPUT ( $\overline{\text { WXIA }} / \overline{W X I B})$

This is a dual purpose pin. For single device mode, see Table I for additional information. $\overline{\mathrm{WXIA}} / \overline{\mathrm{WXIB}}$ is connected to Write Expansion Out ( $\overline{\mathrm{WXOA}} / \overline{\mathrm{WXOB}}$ ) of the previous device in the Daisy Chain Depth Expansion mode.

## READ EXPANSION INPUT ( $\overline{\text { RXIA }} / \overline{\text { RXIB }})$

This is a dual purpose pin. For single device mode, see Table I for additional information. $\overline{\mathrm{RXIA}} / \overline{\mathrm{RXIB}}$ is connectedto Read ExpansionOut $(\overline{\mathrm{RXOA}} /$ $\overline{R X O B})$ of the previous device in the Daisy Chain Depth Expansion mode.

## OUTPUTS:

## FULL FLAGIINPUT READY ( $\overline{\text { FFA }} / \overline{R A}, \overline{\text { FFB }} / \overline{\mathrm{RB}}$ )

This is a dual purpose pin. In IDT Standard mode, the Full Flag ( $\overline{\mathrm{FFA}} /$ $\overline{\mathrm{FFB}}$ ) function is selected. When the FIFO is full, $\overline{\mathrm{FF}}$ will go LOW, inhibiting further write operations. When $\overline{\mathrm{FF}}$ is HIGH, the FIFO is not full. If no reads are performed after a reset, $\overline{F F}$ will go LOW after D writes to the FIFO. D = 256 writes for the IDT72805LB, 512 for the IDT72815LB, 1,024 for the IDT72825LB and 4,096 for the IDT72845LB.

In FWFT mode, the Input Ready ( $\overline{\mathrm{IRA}} / \overline{\mathrm{RB}}$ ) function is selected. $\overline{\mathrm{R}}$ goes LOW when memory space is available for writing in data. When there is no longer any free space left, $\overline{\mathrm{IR}}$ goes HIGH, inhibiting further write operations.
$\overline{\mathrm{R}}$ will go HIGH after D writes to the FIFO. D $=257$ writes for the IDT72805, 513 for the IDT72815, 1,025 for the IDT72825 and 4,097 for the IDT72845. Note that the additional word in FWFT mode is due to the capacity of the memory plus output register.
$\overline{F F} / \bar{R}$ is synchronous and updated on the rising edge of WCLK.

## EMPTY FLAG/OUTPUT READY ( $\overline{\mathrm{EFA}} / \overline{\mathrm{ORA}}, \overline{\mathrm{EFB}} / \overline{\mathrm{ORB}}$ )

This is a dual purpose pin. In the IDT Standard mode, the Empty Flag ( $\overline{\mathrm{EFA}} / \overline{\mathrm{EFB}}$ ) function is selected. When the FIFO is empty, $\overline{\mathrm{EF}}$ will go LOW, inhibiting further read operations. When $\overline{\mathrm{EF}}$ is HIGH, the FIFO is not empty.

In FWFT mode, the Output Ready ( $\overline{\mathrm{ORA}} / \overline{\mathrm{ORB}}$ ) function is selected. $\overline{\mathrm{OR}}$ goes LOW at the same time that the first word written to an empty FIFO appears valid on the outputs. $\overline{\text { OR }}$ stays LOW after the RCLK LOW to HIGH transition that shifts the last word from the FIFO memory to the outputs. $\overline{\text { OR }}$ goes HIGH only with a true read (RCLK with $\overline{\text { REN }}=$ LOW). The previous data stays at the outputs, indicating the last word was read. Further data reads are inhibited until $\overline{\mathrm{OR}}$ goes LOW again.
$\overline{\mathrm{EF}} / \overline{\mathrm{OR}}$ is synchronous and updated on the rising edge of RCLK.

## PROGRAMMABLE ALMOST-FULL FLAG ( $\overline{\text { PAFA }} / \overline{\text { PAFB }})$

The Programmable Almost-Full flag ( $\overline{\mathrm{PAFA}} / \overline{\mathrm{PAFB}}$ ) will go LOW when FIFO reaches the almost-full condition. In IDT Standard mode, if no reads are performed after Reset $(\overline{\mathrm{RS}})$, the $\overline{\mathrm{PAF}}$ will go LOW after ( $256-\mathrm{m}$ ) writes for the IDT72805LB, (512-m) writes for the IDT72815LB, (1,024-m) writes for the IDT72825LB and (4,096-m) writes for the IDT72845LB. The offset " $m$ " is defined inthe Full Offsetregister.

In FWFT mode, if no reads are performed, $\overline{\text { PAF }}$ will go LOW after (257m) writes for the IDT72805LB, (513-m) writes for the IDT72815LB, (1,025m) writes for the IDT72825LB and (4,097-m) writes for the IDT72845LB. The default values for $m$ are noted in Table 1 and 2.

If asynchronous $\overline{\mathrm{PAF}}$ configuration is selected, the $\overline{\mathrm{PAF}}$ is asserted LOW ontheLOW-to-HIGHtransition oftheWriteClock(WCLK). $\overline{\text { PAF }}$ is resetto HIGH onthe LOW-to-HIGH transition of the Read Clock (RCLK). Ifsynchronous $\overline{\text { PAF }}$ configuration is selected (see Table I), the $\overline{\mathrm{PAF}}$ is updated on the rising edge ofWCLK.

## PROGRAMMABLE ALMOST-EMPTY FLAG ( $\overline{\text { PAEA }} / \overline{\text { PAEB }})$

The $\overline{\text { PAE }}$ flag will go LOW when the FIFO reads the almost-empty condition. In IDT Standard mode, $\overline{\text { PAE }}$ will go LOW when there are $n$ words or less in the FIFO. In FWFT mode, the $\overline{\text { PAE will go LOW when there are }}$ $n+1$ words or less in the FIFO. The offset " $n$ " is defined as the Empty offset. The default values for n are noted in Table 1 and 2.

If asynchronous $\overline{\mathrm{PAE}}$ configuration is selected, the $\overline{\mathrm{PAE}}$ is asserted LOW on the LOW-to-HIGH transition of the Read Clock (RCLK). $\overline{\text { PAE }}$ is reset to HIGH on the LOW-to-HIGH transition of the Write Clock (WCLK). If synchronous $\overline{\mathrm{PAE}}$ configuration is selected (see Table I), the $\overline{\text { PAE }}$ is updated on the rising edge of RCLK.

## WRITE EXPANSION OUT/HALF-FULL FLAG ( $\overline{\mathrm{WXOA}} / \overline{\mathrm{HFA}}, \overline{\mathrm{WXOB}} / \overline{\mathrm{HFB}}$ )

This is a dual-purpose output. In the Single Device and Width Expansion mode, when Write Expansion In ( $\overline{\mathrm{WXIA}} / \overline{\mathrm{WXIB}}$ ) and/or Read Expansion In $(\overline{\mathrm{RXIA}} / \overline{\mathrm{RXIB}})$ are grounded, this output acts as an indication of a half-full memory.

After half of the memory is filled, and at the LOW-to-HIGH transition of the next write cycle, the Half-Full flag goes LOW and will remain set until the difference between the write pointer and read pointer is less than or equal to one half of the total memory of the device. The Half-Full flag ( $\overline{\mathrm{HFA}} / \mathrm{HFB}$ ) is then reset to HIGH by the LOW-to-HIGH transition of the Read Clock (RCLK). The $\overline{\mathrm{HF}}$ is asynchronous.

In the Daisy Chain Depth Expansion mode, $\overline{\mathrm{WXI}}$ is connected to $\overline{\mathrm{WXO}}$ of the previous device. This output acts as a signal to the next device in the Daisy Chain by providing a pulse when the previous device writes to the last location of memory.

## READ EXPANSION OUT ( $\overline{\mathrm{RXOA}} / \overline{\mathrm{RXOB}})$

In the Daisy Chain Depth Expansion configuration, Read Expansion In $(\overline{\mathrm{RXIA}} / \overline{\mathrm{RXIB}})$ is connected to Read Expansion Out $(\overline{\mathrm{RXOA}} / \overline{\mathrm{RXOB}})$ of the previous device. This output acts as a signal to the next device in the Daisy Chain by providing a pulse when the previous device reads from the last location of memory.

## DATA OUTPUTS (Q0-Q17, QB0-QB17)

Q0-Q17 are data outputs for 18-bit wide data.

NOTES:

1. Single device mode $(\overline{F L}, \overline{R X I}, \overline{W X I})=(0,0,0),(0,0,1),(0,1,0),(1,0,0),(1,0,1)$ or $(1,1,0) . \overline{F L}, \overline{R X I}, \overline{W X I}$ should be static (tied to Vcc or GND).
2. The clocks (RCLK, WCLK) can be free-running asynchronously or coincidentally.
3. After reset, the outputs will be LOW if $\overline{\mathrm{OE}}=0$ and tri-state if $\overline{\mathrm{OE}}=1$.

Figure 5. Reset Timing ${ }^{(2)}$

## NOTES

1. tSKEW1 is the minimum time between a rising RCLK edge and a rising WCLK edge to guarantee that $\overline{\mathrm{FF}}$ will go HIGH during the current clock cycle. If the time between the rising edge of RCLK and the rising edge of WCLK is less than tskewn, then FF may not change state until the next WCLK edge.
2. Select this mode by setting $(\overline{F L}, \overline{R X I}, \overline{W X I})=(0,0,0),(0,1,1),(1,0,0)$ or $(1,1,1)$ during Reset.

NOTES:

1. tSKEw1 is the minimum time between a rising WCLK edge and a rising RCLK edge to guarantee that $\overline{E F}$ will go HIGH during the current clock cycle. If the time between the rising edge of WCLK and the rising edge of RCLK is less than tskEw1, then $\overline{\mathrm{EF}}$ may not change state until the next RCLK edge.
2. Select this mode by setting $(\overline{\mathrm{FL}}, \overline{\mathrm{RXI}}, \overline{\mathrm{WXI}})=(0,0,0),(0,1,1),(1,0,0)$ or $(1,1,1)$ during Reset.

Figure 7. Read Cycle Timing with Single Register-Buffered EF (IDT Standard Mode)

## NOTES:

 applies only at the Empty Boundary ( $\overline{\mathrm{EF}}=\mathrm{LOW}$ ).
2. The first word is available the cycle after $\overline{\mathrm{EF}}$ goes HIGH, always.
3. Select this mode by setting $(\overline{\mathrm{FL}}, \overline{\mathrm{RXI}}, \overline{\mathrm{WXI}})=(0,0,0),(0,1,1),(1,0,0)$ or $(1,1,1)$ during Reset.

Figure 8. First Data Word Latency with Single Register-Buffered EF (IDT Standard Mode)

NOTES:

1. tSKEW1 is the minimum time between a rising RCLK edge and a rising WCLK edge to guarantee that $\overline{\mathrm{FF}}$ will go HIGH during the current clock cycle. If the time between the rising edge of RCLK and the rising edge of WCLK is less than tsKEW1, then $\overline{F F}$ may not change state until the next WCLK edge.
2. Select this mode by setting $(\overline{\mathrm{FL}}, \overline{\mathrm{RXI}}, \overline{\mathrm{WXI}})=(0,0,0),(0,1,1),(1,0,0)$ or $(1,1,1)$ during Reset.

Figure 9. Single Register-Buffered Full Flag Timing (IDT Standard Mode)

NOTES:

1. When tSKEW1 minimum specification, tFRL (maximum) $=$ tCLK + tSKEW1. When tSKEW1 < minimum specification, tFRL (maximum) $=$ either 2 * tCLK + tSKEW1, or tCLK + tsKEW1. The Latency Timing apply only at the Empty Boundary ( $\overline{E F}=\mathrm{LOW}$ ).
2. Select this mode by setting $(\overline{\mathrm{FL}}, \overline{\mathrm{RXI}}, \overline{\mathrm{WXI}})=(0,0,0),(0,1,1),(1,0,0)$ or $(1,1,1)$ during Reset.

## NOTES:

1. $n=$ PAE offset.
2. For IDT Standard Mode.
3. For FWFT Mode.
4. tskEw2 is the minimum time between a rising WCLK edge and a rising RCLK edge for $\overline{\mathrm{PAE}}$ to go HIGH during the current clock cycle. If the time between the rising edge of WCLK and the rising edge of RCLK is less than tSKEW2, then the $\overline{\text { PAE }}$ deassertion may be delayed one extra RCLK cycle.
5. $\overline{\mathrm{PAE}}$ is asserted and updated on the rising edge of RCLK only.
6. Select this mode by setting $(\overline{F L}, \overline{R X I}, \overline{W X I})=(1,0,0),(1,0,1)$, or $(1,1,0)$ during Reset.

Figure 22. Synchronous Programmable Almost-Empty Flag Timing (IDT Standard and FWFT Modes)

NOTES:

1. $m=\overline{\mathrm{PAF}}$ offset.
2. $D=$ maximum FIFO Depth.

In IDT Standard Mode: $\mathrm{D}=256$ for the IDT72805, 512 for the IDT72815, 1,024 for the IDT72825 and 4,096 for the IDT72845.
In FWFT Mode: $\mathbf{D}=257$ for the IDT72805, 513 for the IDT72815, 1,025 for the IDT72825 and 4,097 for the IDT72845.
3. tSKEW2 is the minimum time between a rising RCLK edge and a rising WCLK edge for $\overline{\text { PAF }}$ to go HIGH during the current clock cycle. If the time between the rising edge of RCLK and the rising edge of WCLK is less than tskew2, then the $\overline{\text { PAF }}$ deassertion time may be delayed an extra WCLK cycle.
4. $\overline{\mathrm{PAF}}$ is asserted and updated on the rising edge of WCLK only.
5. Select this mode by setting $(\overline{F L}, \overline{R X I}, \overline{W X I})=(1,0,0),(1,0,1)$, or $(1,1,0)$ during Reset.

Figure 23. Synchronous Programmable Almost-Full Flag Timing (IDT Standard and FWFT Modes)

NOTES:

1. tskewn is the minimum time between a rising RCLK edge and a rising WCLK edge to guarantee that FF will go HIGH after one WCLK cycle plus twfF. If the time between the rising edge of RCLK and the rising edge of WCLK is less than tsKEW1, then the $\overline{F F}$ deassertion time may be delayed an extra WCLK cycle.
2. $\overline{\mathrm{LD}}=\mathrm{HIGH}$.
3. Select this mode by setting $(\overline{\mathrm{FL}}, \overline{\mathrm{RXI}}, \overline{\mathrm{WXI}})=(0,1,0)$ or $(1,1,0)$ during Reset.

Figure 24. Double Register-Buffered Full Flag Timing (IDT Standard Mode)

NOTES:

1. tSKEW1 is the minimum time between a rising RCLK edge and a rising WCLK edge to guarantee that $\overline{F F}$ will go HIGH after one WCLK cycle plus trFF. If the time between the rising edge of RCLK and the rising edge of WCLK is less than tsKEW1, then the $\overline{F F}$ deassertion may be delayed an extra WCLK cycle.
2. $\overline{\mathrm{LD}}=\mathrm{HIGH}$.
3. Select this mode by setting $(\overline{\mathrm{FL}}, \overline{\mathrm{RXI}}, \overline{\mathrm{WXI}})=(0,1,0)$ or $(1,1,0)$ during Reset.

Figure 25. Write Cycle Timing with Double Register-Buffered FF (IDT Standard Mode)

## NOTES:

1. tSKEW1 is the minimum time between a rising WCLK edge and a rising RCLK edge to guarantee that $\overline{E F}$ will go HIGH after one RCLK cycle plus tref. If the time between the rising edge of WCLK and the rising edge of RCLK is less than tsKEW1. then the $\overline{E F}$ deassertion may be delayed an extra RCLK cycle.
2. $\overline{\mathrm{LD}}=\mathrm{HIGH}$
3. Select this mode by setting $(\overline{\mathrm{FL}}, \overline{\mathrm{RXI}}, \overline{\mathrm{WXI}})=(0,1,0)$ or $(1,1,0)$ during Reset.

Figure 26. Read Cycle Timing with Double Register-Buffered EF (IDT Standard Timing)

## NOTES:

1. TSKEW1 is the minimum time between a rising WCLK edge and a rising RCLK edge for OR to go HIGH during the current cycle. If the time between the rising edge of WLCK and the rising edge of RCLK is less than tskewi, then the $\overline{O R}$ deassertion may be delayed one extra RCLK cycle.
2. $\mathrm{LD}=\mathrm{HIGH}, \mathrm{OE}=\mathrm{LOW}$
3. Select this mode by setting $(\overline{\mathrm{FL}}, \overline{\mathrm{RXI}}, \overline{\mathrm{WXI}})=(0,0,1)$ or $(1,0,1)$ during Reset.

Figure 27. $\overline{\mathrm{OR}}$ Flag Timing and First Word Fall Through when FIFO is Empty (FWFT mode)

## OPERATING CONFIGURATIONS

## SINGLE DEVICE CONFIGURATION

Each of the two FIFOs contained in a single IDT72805LB/72815LB/ 72825LB/72845LB may be used as astand-alone device when the application
requirements are for 256/512/1,024/4,096 words or less. These FIFOs are in a single Device Configuration when the First Load ( $\overline{\mathrm{FL}}$ ), Write Expansion In ( $\overline{\mathrm{WXI}}$ ) and Read Expansion $\ln (\overline{\mathrm{RXI}})$ control inputs are configured as ( $\overline{\mathrm{FL}}, \overline{\mathrm{RXI}}$, $\overline{\mathrm{WXI}}=(0,0,0),(0,0,1),(0,1,0),(1,0,0),(1,0,1)$ or $(1,1,0)$ during reset (Figure 28).

RESET ( $\overline{\mathrm{RS}})$

Figure 28. Block Diagram of Single $256 \times 18,512 \times 18,1,024 \times 18,4,096 \times 18$ Synchronous FIFO
(One of the two FIFOs contained in the IDT72805LB/72815LB/72825LB/72845LB)

## WIDTH EXPANSION CONFIGURATION

Word width may be increased simply by connecting together the control signals of FIFO A and B. Status flags can be detected from any one device. The exceptions are the Empty Flag/Output Ready and Full Flag/Input Ready. Because of variations in skew between RCLK and WCLK, it is possible for flag assertion and deassertion to vary by one cycle between FIFOs. To avoid problems the user must create composite flags by gating the Empty Flags/Output Ready of every FIFO, and separately gating all Full

Flags/Input Ready. Figure 29 demonstrates a 36 -word width by using one IDT72805LB/72815LB/72825LB/72845LBs. Any word width can be attained by adding additional IDT72805LB/72815LB/72825LB/72845LBs. These FIFOs are in a single Device Configuration whenthe FirstLoad ( $\overline{\mathrm{FL}})$, Write Expansion In ( $\overline{\mathrm{WXI}})$ and Read Expansion In $(\overline{\mathrm{RXI}})$ control inputs are configured as ( $\overline{\mathrm{FL}}$, $\overline{\mathrm{RXI}}, \overline{\mathrm{WXI}}=(0,0,0),(0,0,1),(0,1,0),(1,0,0),(1,0,1)$ or $(1,1,0)$ during reset (Figure 29). Please see the Application Note AN-83.
 NOTE:

1. Do not connect any output control signals directly together.

Figure 29. Block Diagram of the two FIFOs contained in one IDT72805LB/72815LB/72825LB/72845LB configured for a 36-bit Width Expansion

## DEPTH EXPANSION CONFIGURATION — DAISY CHAIN TECHNIQUE (WITH PROGRAMMABLE FLAGS)

These devices can easily be adapted to applications requiring more than 256/512/1,024/4,096 words of buffering. Figure 30 shows Depth Expansion using one IDT72805LB/72815LB/72825LB/72845LBs. Maximum depth is limited only by signal loading. Follow these steps:
1.ThefirstdevicemustbedesignatedbygroundingtheFirstLoad (F్̄) controlinput.
2. All other devices must have $\overline{F L}$ in the HIGH state.
3. The Write Expansion Out ( $\overline{\mathrm{WXO}}$ ) pin of each device must be tied to the Write Expansion In (WXI) pin of the next device. See Figure 30.
4. The Read ExpansionOut( $\overline{\mathrm{RXO})}$ pin of each device mustbetiedtothe Read Expansion In ( $\overline{\mathrm{RXI}})$ pin of the next device. See Figure 30.
5. All Load ( $\overline{\mathrm{LD}}$ ) pins are tied together.
6. The Half-Full flag ( $\overline{\mathrm{HF}}$ ) is not available in this Depth Expansion Configuration.
7. $\overline{\mathrm{EF}}, \overline{\mathrm{FF}}, \overline{\mathrm{PAE}}$, and $\overline{\mathrm{PAF}}$ are created with composite flags by ORing together every respective flags for monitoring. The composite $\overline{\text { PAE }}$ and $\overline{\text { PAF flags are not precise. }}$
8. In Daisy Chain mode, the flag outputs are single register-buffered and the partial flags are in asynchronous timing mode.

Figure 30. Block Diagram of 8,192 x 18 Synchronous
FIFO Memory With Programmable Flags used in Depth Expansion Configuration

## DEPTH EXPANSION CONFIGURATION (FWFT MODE)

In FWFT mode, the FIFOs can be connected in series (the data outputs of one FIFO connected to the data inputs of the next) with no external logic necessary. The resulting configuration provides a total depth equivalent to the sum of the depths associated with each single FIFO. Figure 31 shows a depth expansion using one IDT72805LB/72815LB/72825LB/72845LB devices.
Care should be taken to select FWFT mode during Master Reset for all FIFOs in the depth expansion configuration. The first word written to an empty configuration will pass from one FIFO to the next ("ripple down") until it finally appears at the outputs of the last FIFO in the chain-no read operation is necessary but the RCLK of each FIFO must be free-running. Each time the data word appears at the outputs of one FIFO, that device's $\overline{\mathrm{OR}}$ line goes LOW, enabling a write to the next FIFO in line.

For an empty expansion configuration, the amount of time it takes for $\overline{\mathrm{OR}}$ of the last FIFO in the chain to go LOW (i.e. valid data to appear on the last FIFO's outputs) after a word has been written to the first FIFO is the sum of the delays for each individual FIFO:

$$
(\mathrm{N}-1)^{\star}\left(4^{* t r a n s f e r ~ c l o c k}\right)+3 * \text { TrcLK }
$$

where $N$ is the number of FIFOs in the expansion and TrCLK is the RCLK period. Note that extra cycles should be added for the possibility that the
tSKEW1 specification is not met between WCLK and transfer clock, or RCLK and transfer clock, for the $\overline{\mathrm{OR}}$ flag.
The "ripple down" delay is only noticeable for the first word written to an empty depth expansion configuration. There will be no delay evident for subsequent words written to the configuration.

The first free location created by reading from a full depth expansion configuration will "bubble up" from the last FIFO to the previous one until it finally moves into the first FIFO of the chain. Each time a free location is created in one FIFO of the chain, that FIFO's $\overline{\mathrm{R}}$ line goes LOW, enabling the preceding FIFO to write a word to fill it.
For a full expansion configuration, the amount of time it takes for $\overline{\mathrm{IR}}$ of the first FIFO in the chain to go LOW after a word has been read from the last FIFO is the sum of the delays for each individual FIFO:

$$
(\mathrm{N}-1)^{\star}\left(3^{\star t r a n s f e r ~ c l o c k}\right)+2 \text { TwcLK }
$$

where N is the number of FIFOs in the expansion and TwcLk is the WCLK period. Note that extra cycles should be added for the possibility that the tSKEW1 specification is not met between RCLK and transfer clock, or WCLK and transfer clock, for the $\overline{\mathrm{R}}$ flag.
The Transfer Clock line should be tied to either WCLK or RCLK, whichever is faster. Both these actions result in data moving, as quickly as possible, to the end of the chain and free locations to the beginning of the chain.

Figure 31. Block Diagram of $512 \times 18,1,024 \times 18,2,048 \times 18,8,192 \times 18$ Synchronous FIFO Memory With Programmable Flags used in Depth Expansion Configuration

## ORDERING INFORMATION

NOTES:

1. Industrial temperature range product for the 15 ns speed grade is available as a standard device.
2. Green parts are available. For specific speeds and packages contact your sales office.

LEAD FINISH (SnPb) parts are in EOL process. Product Discontinuation Notice - PDN\# SP-17-02
3. The PBGA is only available for the IDT72805LB/72815LB/72825LB in the 15 or 25 ns speed grade.
